Medical supply drone equipment

Our team prepares equipment proposals for health authorities and humanitarian organisations considering medical cargo drones for communities where road access is limited or disrupted. We can specify a drone, a compatible carrier and the accessories needed for the supplies the institution plans to transport.

Choosing a drone and carrier

Institutions can specify the weight and dimensions of the medical supplies they expect to carry. We would use those requirements to compare cargo drone models, compatible carriers and the manufacturer's stated payload limits.

Choosing an insulated carrier

Tell us the temperature range your supplies require. We can compare carrier dimensions, compatible temperature loggers and, where available, the manufacturer's test data showing how long a carrier maintained that range and under what conditions.

Keeping the equipment serviceable

Battery chargers, spare batteries, protective cases and equipment-status displays can be quoted with each model. Handover would cover the supplied components, care and storage instructions, warranty terms and how to request servicing or spare parts.

Request an equipment specification

Share the quantities needed, your country, delivery location, payload requirements and available charging power. Our team can then prepare an itemised quotation for the equipment, delivery to your institution and technical support.
